

Mouse, the Language

[URL: http://primepuzzle.com/mouse/mouse6.html](http://primepuzzle.com/mouse/mouse6.html)

Last changed on Tuesday, April 24, 2007. A more recent update was made on December 30, 2021

The Z80 CPU emulator uses the file BOOT.CPM. CP/M is a disk operating system (DOS) for microcomputers. CP/M has 8 built-in commands. They are :

DIR - lists all the files in the current drive and current user area - the prompt, eg. A0>, reflects both the current drive letter and current user area.

USER n - switch to user area n on the current drive; n may be 0 thru 15.

TYPE filename.typ - displays the contents of the specified file (a text file) on the screen.

REN newname.typ=oldname.typ - rename a file.

ERA filename.typ - erase a file.

d: - switch to drive d: - example B: or C: or A:

SAVE n filename.typ - saves n pages of memory starting at address 100 (hex) to specified file; a page is 256 bytes.

GET addr filename.txt - loads memory starting at hex address addr from the contents of specified file.

The emulator, MYZ80, supports three "virtual" drives, A: thru C: and a RAM drive, D:. The sample programs discussed in this tutorial have been saved on drive B:, so issue the command B: and then the command DIR to see them.

There's a file on the A: drive called HELLO.TXT which contains some important information. To read it you may issue the command

A0>TYPE HELLO.TXT

A file which was originally named MYZ80GO.COM was renamed to MYZ80GO.CPM. Files which have names that end in .COM are "transient" commands and may be run by typing their filename (without the .COM part). I have replaced the original MYZ80GO.COM with my own. MYZ80GO is run at startup. A program called

NZBLITZ.COM was used to create this Z-System image. You may return to CP/M w/ the command **NZCPM**.

I have put a text editor, **ZDE.COM**, on drive **A:**. It's probably easier to create your Mouse programs with an external editor and then **IMPORT** them into the emulator but, if you want, you may use **ZDE**. It has built-in help via the **Esc-H** command. **ZDE** uses the so-called "WordStar diamond" to move the cursor up-down-left-right (**Ctrl-E**, **Ctrl-X**, **Ctrl-S**, **Ctrl-D**). If, before invoking **ZDE**, you issue the command

A0>KEY MYZ80.KEY

then, when you use **ZDE**, the arrow keys may be used instead of the WordStar diamond.

Finally, I have put the "transient" command **COPY.COM** in **A0**: This program may be used to copy files from one place to another. For example :

A0>COPY PRIME.MSE B0:

would copy the **PRIME.MSE** file from drive **A0**: to drive **B0**:
